

Off-Chain Collateral

Borrow Onchain Against Custodied
Collateral via Tri-Party Agreement

kamino

Get Onchain Liquidity. Retain Qualified Custody. Avoid Smart Contract Risk.

What It Is

Kamino Off-Chain Collateral enables institutions to borrow stablecoins onchain while its collateral remains in qualified custody, entailing no smart contract risk to underlying holdings, while tapping into Kamino's onchain liquidity layer.

Tri-Party Agreement and Chainlink Pricing

This structure is governed by a tri-party agreement between the borrower, custodian, and Kamino's SPV (representative of liquidity providers).

Collateral value is verified via Chainlink attestations, read directly from custodian balances, and published at regular intervals.

White-Glove Market Setup

Eligible collateral assets for Kamino's Off-Chain Collateral product includes SOL, natively staked SOL, and BTC, with more to be added pending demand.

Kamino creates a private, isolated market for the borrower, with parameters tailored as needed

Designed for Institutional Requirements

Collateral kept in
qualified custody
(Anchorage Digital)

Collateral attested
via Chainlink Proof
of Reserves

USDC as primary
borrow asset

70% liquidation LTV
(asset-dependent)

Fixed rates loans,
rate dependent on
collateral. 3 month
fixed-terms with
option to rollover

Tri-Party Agreement Structure

Repo-style controls, with longer dated loans

A tri-party agreement between Kamino's SPV (representative of liquidity providers), the Custodian (Anchorage), and the Borrower governs the entire relationship: asset lock, margining requirements, and liquidation procedures.

Qualified Custodian (Anchorage)

Holds borrower assets in qualified custody. Cannot lend, rehypothecate, or make margin loans on collateral while the agreement is in effect.

Borrower

Deposits collateral into a segregated account at the custodian. Borrows against the attested value via Kamino. Cannot withdraw from custody to exceed max LTV while a loan is outstanding.

Secured Party (Kamino)

Kamino's SPV holds a first-priority security interest in the collateral on behalf of liquidity providers, and has the right to issue a liquidation notice in the event of default.

Liquidation Mechanics

What triggers liquidation?

Collateral value falls below required threshold (LTV breach) or loan reaches maturity without repayment.

01

Kamino and Anchorage monitor loan health continuously

02

Borrower subscribes to LTV notifications. Can top up at any time before Liquidation LTV is breached.

03

Once Liquidation LTV breached, collateral is frozen and queued for partial liquidation.

04

Brokerage desk books trade to sell collateral for USDC. 24h later, proceeds are exchanged and debt settled on Kamino.

Underlying Mechanics

- 01 Assets locked at qualified custodian
- 02 Chainlink attests custodied balances on a rolling basis.
- 03 Borrower receives 1:1 representation of custodied assets
- 04 Custom market setup with parameters tailored to requirements
- 05 Fixed rate, fixed term USDC borrow via Kamino.

Why Use Off-Chain Collateral

Access liquidity without liquidating.

Borrow stablecoins against custodied crypto holdings. Maintain exposure to price action. Fund operations, strategic investments, or market opportunities without selling underlying collateral.

Maintain qualified custody status.

Assets remain at a federally chartered bank throughout the loan lifecycle. Bankruptcy-remote protections preserved. KYC/AML compliance maintained through the custodian. No smart contract exposure for underlying assets.

Continue earning staking yield.

Assets in custody can continue earning staking rewards (if applicable) throughout the loan, subject to custody arrangement.

Operational simplicity.

No internal approvals to move assets out of custody. No onchain transfers for collateral. One-time facility setup, then borrow and repay via Kamino's interface.

Battle-tested. Transparent. Trusted.

Kamino is Solana's largest on-chain lending and risk infrastructure provider with an established operating record at scale. Kamino's infrastructure is fully open source and has undergone 18 independent security audits and multiple formal verifications. The protocol is used by institutional participants including licensed exchanges, federally chartered digital asset banks, and publicly listed companies.
