Kamino Private Credit connects DeFi users on Solana with institutional Bitcoin-backed lending.

Private Credit deploys capital to regulated lending operations that make overcollateralized loans to verified institutional borrowers. Collateral is secured in Qualified Custodians, with no title transfer to the Lender and no collateral rehypothecation

Private Credit provides a high level of transparency, with ongoing collateral and loan-health reporting, and monthly third-party collateral attestations.

The vault operates with conservative risk parameters including 60% maximum LTV ratios and no rehypothecation of collateral.

What makes Kamino Private Credit unique?

Attribute	Traditional DeFi	Kamino Private Credit
Yield Source	Onchain Borrowing Demand	Institutional BTC-backed lending
Underlying Borrower Profile	Pseudonymous	KYC-verified institutional entities
Collateral Location	Smart Contracts	Qualified custodians
Collateral Coverage	Up to 86%	60% Max LTV
Regulatory Oversight of Lending	None	Funds only deployed to Swiss & Liechtenstein-regulated Lenders
Liquidity	Instant, utilization-dependent (utilization typically ~85%)	Hybrid (5-10% instant + queued)
Rates & Term	Floating based on supply/demand	Fixed Rates. Fixed Term.

How it Works

- 01 Deposit stablecoin into Kamino Private Credit Vault
- 02 Funds move through a Special purpose vehicle (SPV) to regulated lending operations. Overcollateralized BTC-backed loans are originated to institutional borrowers.
- 03 Collateral remains secure at qualified custodians under a tripartite agreement, with no title transfer to the borrower. Reporting transparency will be maintained throughout, and 3rd party attestation will be available to Kamino users.
- 04 Returns from the lending activity flow back to vault depositors.

One deposit.
Passive yield.
Institutional credit exposure.

Getting Started with Kamino Private Credit

Deposits

Deposit stablecoin to receive vault share tokens at current vault Net Asset Value (NAV).

Share value appreciates as the vault earns interest from lending activities. The process is permissionless - deposit, receive shares, accrue value.

As part of the deposit process, you will be asked to agree to a loan agreement with the Private Credit SPV and accept the terms.

Withdrawals

Instant redemption is available up to the liquidity buffer (explained in the operational information section).

Liquidity will be managed such that a liquidity buffer is maintained by default. Withdrawals that exceeds the liquidity buffer will enter a first-in first-out withdrawal queue — processing when liquidity becomes available.

Loans are originated across a range of fixed durations (e.g. 30-day, 60-day, 90-day, etc)

Operational Information

Parameter	Terms
Target Yield	6–8% APY
Deposit Currency	USDC, USDT, USDG and more
Instant Liquidity Buffer	5-10% of AUM
Redemption Model	Hybrid (instant buffer + queued)
Underlying Collateral	High-quality digital assets (currently BTC-only)
Maximum LTV	60%
Collateral Rehypothecation	Prohibited. BTC title remains with the Borrower
Regulatory Oversight	Lending operation regulated by Liechtenstein Financial Market Authority (FMA)

Reporting & Transparency

Institutional overcollateralized lending introduces a reliance on external operations

Thus, Kamino Private Credit ensures that: funds are deployed only to highly regulated institutions in top tier jurisdictions; collateral is always in qualified custodians; and high levels of transparency are maintained at all times enabled by continuous reporting.

Reporting will include the following:

Collateral Position Reporting

Ongoing reporting attesting the aggregate collateral value backing loans.

In-App Loan Status Reporting

Ongoing reporting that attest to active loan amounts, weighted average LTVs, and overall loan health, powered by Haruko — the exact same data source used by the regulator

Third-Party Attestations

Independent verification of positions by Andersen UK on a monthly recurring basis.

Liquidity Management

Kamino's Private Credit vault structure maintains multiple liquidity management layers to manage redemptions:

Kamino Vault maintains 5-10% instant liquidity for immediate redemptions.

Defined loan maturities enable predictable liquidity planning

FIFO redemption queue automatically processes redemptions when buffer is exhausted, as new liquidity becomes available
